If you look at PDF with a text editor, you will see that there is a field not shown by documentdialog: This is the PDF document ID. It turns out that the ID of the document was (in version 2.4 of OpenOffice.org) built as a digestive MD5 of some fields, as shown by this code: The aGMT field can be re-created knowing the m_aCreationDateString field, which is stored on the PDF as: Since we know that the Satoshi PC was a Windows XP, then we also know that aGMT has only millisecond precision. The CreationDate field does not store milliseconds, but an attacker can easily force the millisecond field and find the correct value. The external field contains the fields Creator, Producer and CreationDate already present in the PDF, in their hexadecimal format: I know aInfoValues Outside would be: m_aContext. The URL is the interesting part: it contains the path and name of the PDF where it was originally located, in Unicode format. I'm sure Satoshi knew how the data loss of products, and probably located the file in some innocent path like “c:\bitcoin\src\docs”. But while he publishes one of the most extraordinary documents ever seen, he may have been too expelled to remind him. Then the URL may have been something like this: Here JLewis is just an example of a possible username. Unfortunately, the file:// url is for a temporary file (e.g. C:\tmp\djask.tmp), rather than the exported .pdf file or even the .odt source file: so as not to give anything away. See PDFFilter::implExport() in filter/source/pdf/pdffilter.cxx in the OpenOffice 2.4 source code: Skip to main content Is there a place where I can find the Bitcoin whitepaper from satoshi in plain text markdown format? Bitcoin, both the network and cryptocurrency, have been in circulation over the past twelve years and have grown to unprecedented levels in the last ten years. What most enthusiasts do not know is how heritagewas first introduced to the world; through a pdf document. Posted on 31 October 2008, “Bitcoin: A Peer-to-Peer Peer-to-PeerCash system was created as a solution against the global financial crisis, providing a closed circuit monetary system that was completely decentralized and incorruptible. The document, which uses mathematical concepts dating back to 1957, was presented under the pseudonym â € œSatoshi Nakamotoâ €. The real identity of the creator (s) is still to be discovered. Here we provide a summary of the most important information covered in the WhitePaper Bitcoin, narrowing it in crucial points to give readers an understanding of the because Bitcoin has been created and what his developer (i) tried to make. The aim of the Bitcoin network was the aim of essentially eliminating the model based on the trust of digital transactions by creating a digital representation of hard money. Whether it's online shopping or using credit cards in stores, the payment standard until then has always been made through financial institutions that approve and perform every transaction. By creating an electronic cash system, it eliminates the need for trust in third party suppliers. The goal was created by creating an asset, bitcoin, which allows peer-to-peer transactions that are immutable and encrypted through encryption to protect users from fraud. The WhitePaper Bitcoin has tried to satisfy the structures of Cié who was considered healthy money during the ETã. Bitcoin had to work as a means of exchange, account unit and value deposit. In the creation of a solid alternative to the existing monetary system, Satoshi has also found the principles of durability, divisibility, portability, intrinsic value and scarce. Transactions for the work system, what is now called the â € œBlockchain "has been created. Transactions take place in a cooperative network that is maintained active by sharing transactional activities with all acifirev acifirev eter al ,niahckcolb led etnetu ortla nu da nioctib erirefsart elouv onuclauq odnauQ .onazzilitu ol ehc oloclac id Eht ,tcerroc nevorp ecno .niahc eht otni of skcehc hcihw ,sâ€âc€TRE dehcatta sÂÂÃ¢taht rebmun modnar a ot noitcasnart hcae gnitubirtta yb skrow WoP ehT .detnemelpmi saw metsys)WoP(kroW fo foorP a ,yltcerroc gninoitcnuf era snoitcasnart eht taht evorp oT kroW fo foorP .sah krowten eht sedon erom eht decuder yltnacifingis si gnidneps-elbuod fo ecnahc eht ,reviecer/rednes dna sedon yb deifirev ,decnuonna ylcilbup si noitcasnart yreve ecniS .skcolb dna snoitcasnart gnitadilav ni niahckcolb eht spleh hcihw ,edon a emoceb nac yadot elbaliava sretupmoc tsoM .niahckcolb elohw eht fo seipoc esinorhcnys dna tsoh taht smarggorp gnurp ,seddon gnitsixe lla ll la ll l deifirev nihckcolb eht noitcasnart yreve ,diova ot ot otneps-elbuod rof pud etaerc llits tub selif refsnart dluoc sresu erehw ,nioctib erofeb edaced a naht erom detsixe smroftalp P2P ,lla retfA .tessa emas eht gnidnepser fo ytilibissop eht htiw ,elbaliava emaceb tsrif seicnerruc dna stessa latigid ecno decafrus gnidneps-elbuoD gnidneps-elbuod gnivloS Ã Ã .skcolb fo niahc eht gnitaerc suht ,gnidaeh si ti erehw dna ylsuoiverp detsixe tnuoma eht erehw syalpsid taht ÂÃÂ¢pmatsemitÂÃÂ¢ a sllac repapetihw nioctiB eht tahw ni deretsiger si noitcasnart hcaE .niahckcolb nioctib eht no snoitcasnart FO drocer a ssecca ot resu yna gniwolla ,cilbup meht edam kwwten nioct between ,duarf rof moor on sâ€â€JEHT dna ,deifirev ehvis snotcasnar ââ Jã ,sdnuf sâ€â€â€â€â€ROL Regnnol on ltuoma eht taht taht taht stress krowten ,Yaw taht .)KCOLB ERUTUFF It is performed. The puzzle resolution process blocks each chronology of the transactions in blocks of the network accumulated and grow in size as they end more transactions. The transactions to reverse would require immense computational power; 51% of the entire Bitcoin hashpower to reverse only one hour of transactions, for example. To ensure adequate power, those who perform the operations are compensated in bitcoin based on the number of validated transactions. That is called Bitcoin Mining.ã ¢ Bitcoin Mining - The Mining Bitcoin incentive simply means using the calculation system of one to process blockchain transactions. In return, the miners are compensated in Bitcoin as new transaction blocks are created and determine the way the network operates under a 51%majority system. The mining process is that the creator (i) Bitcoin calls the incentive; A reason for people to maintain a completely decentralized and functioning network, ensuring that you continue to grow in adoption. The White Paper Bitcoin also mentions a predetermined number of coins to be extracted, causing a maximum Bitcoin supply of 21 million. Once all the coins are extracted, the incentive continues in the form of transaction commissions that oscillate freely and are based on the changing hashrate of the network. To find out more about Bitcoin Mining and how it works, read our article "Mining of Bitcoin: an overview". Resolution of the Byzarian Byzantine failure is the potential problem that tackles the computers that participate in a shared system, in which the picture may fail if the participants do not agree on a strategy for the network. The error assumes that some members are corrupt, inefficient or non -democratic, noting that a single bankruptcy point is sufficient to jeopardize the entire approach. Bitcoin blockchain solves Byzantine error through its work test algorithm, allowing the implementation of new strategies only if 51% of the network agrees with the process. As number ofIt continues to grow, the probabilities of malicious participants who take control of the blockchain become more unlikely. According to Business Insider, there are about one million miners currently active globally, which would require about 510,000 people to agree on intentionally compromising the blockchain for the Byzantine fault of being successful. Privacy Privacy Privacy was one of the most large concerns that led to the creation of Bitcoin; The possibility of translating funds into a safe network without compromising personal information to third parties. The idea of technologies that improve privacy dates back to the early 90s with the rise of the Cypherpunk movement, encryption enthusiasts who have sought ways to make digital systems more private and under the only authority of its users. The fundamental concepts of the movement can be seen in the manifesto of a Cipherpunk, written by the mathematician and programmer Eric Hughes. While traditional banking systems limit users of users in transactions, it is still based on the owner of the account that trusts the institution in order to access their data and safeguard their privacy. In the Bitcoin network, all account owners are identified by their addresses; random sequences of 26-35 characters. To send or receive activities, everything is one of which a user needs is the blockchain address with which to interact. The audience can see all Bitcoin transactions in the blockchain with maximum transparency, but the chain records only the addresses without connecting the transaction to private information. Take pay id, for example; Even if the account owner uses an email generated randomly or a cell phone number to record and conclude the transactions, the ID is attached to their banking supplier containing full name, security number repapetihw repapetihw nioctiB li edulcnoc otomakaN ihsotaS enoisulcnoC .eirassecen inoizamrofni el ettut onatneserppar ilausac irettarac i ,niahckcolb izziridni ilg noC .cce ,asac id ozziridni moc.pacorez.www moc.pacorez.www beW otis ortson li eratisiv o]ottetorp liame[ozziridni'lla maet li erattatnoc ,¹Ãip id enrepas reP .erottes led redael azzerucis noc ilatigid esrosir ella otirtta aznes ossecca onorffo azzehccir id amrofattaip al e otnemitsevni id maet ortson lI .elabolg ollevil a itnarimignul inoizutitsi e irotitsevni a aidotsuc id izivres e ilatigid ¯Ãtivitta id itnemitsevni ecsinrof ¢ÃpacoreZ SU us inoizamrofnI .etazzimissam eresse onossop non ehc etenom id atatimil atreffo :atreffo id arutinroF .oizittif emon :ominoduesP .erotivecir a etnettim ad etnematterid ,etrap azret anu onoglovnioc non ehc inoizasnart :reep-ot-reeP .etlov eud .irotaroballoc id ocitarcomed ordauq nu ad otamittigel e otanroigga odnesse ,elartnec enoizutitsi'nu us otnemadiffa af non ehc ametsis nu :otazzilartneced ¢Ã.letnI erossecorp nu .aicudif e erolav ,oraned id ittecnoc itnedecerp irtson i adifs e elabolg otacrem li etoucs aro ehc elatigid atulav anu ,asrob ni otaibmacs otats ¨Ã nioctiB omirp li odnauq ad inna icidnu isauq itassap onoS .0102 led oilgul len etrepa inoizaizogen el e otsiuqca'l rep elibinopsid atulav al noc ,9002 led oianneg len atats ¨Ã nioctiB enoizasnart amirp aL .nioctiB us otaicsalir elaiciffu elif omitlu e omirp li otats ¨Ã nioctiB repaP etihW lI .elibitturrocni enamir ametsis oretni'l ,itseno idon ad atiutitsoc ¨Ã eter alled etrap roiggam al ehc otnatnif ,e UPC alled eretop orol li noc atov odon ingO .idon i art otov id ametsis nu osrevartta atacifidom eresse ²Äup eter aretni'l ehc ecsiraihc otomakaN .etitrevni o etaiggennad eresse onossop non ehc inoizasnart el ettut id acilbbup enoizartsiger al noc reep-ot-reep eter anu osrevartta aseps aippod al ecsidepmi e izret us otnemadiffa af non ehc enoizasnart id ametsis nu otsoporp ah otnemucod lI .otrepoc are ehc ²Äic id otnussair nU
